

XY Cutters

The Autocutter 32/8 and Autocutter 62/6 are designed as stand-alone cutters for media widths up to 81.2cm (32 in.) and 160 cm (62 in.) respectively.

They feature fully automated, unattended cutting of single prints and print combinations generated on the Durst Lambda and Epsilon imagers and, in the case of the Autocutter 62, the Rho 160.

The Durst XY cutters dramatically increase the productivity of large print runs, especially when smaller print sizes are produced. They help to make Durst imaging equipment even more important and profitable production tools.

The cutters automatically cut any combination of print sizes in both X and Y directions and automatically recognise Durst production marks for unattended operation. They cut all photographic media (paper, backlit films, laminated etc.), as well as suitable inkjet media whilst automatically separating the waste from the prints. Durst
